# ILLUSTRATED SECTION

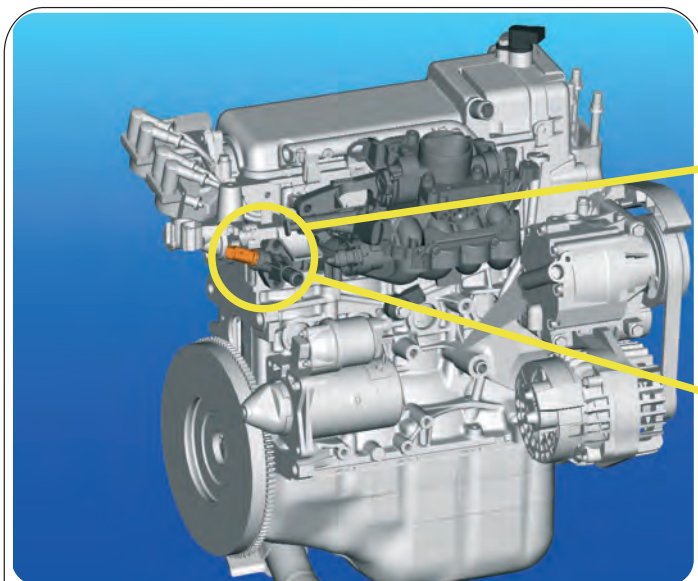

EPS-TM19Q4

-PARTE FIGURATA -PARTIE ILLUSTRÉE -BILDT EIL -PARTE ILUSTRADA

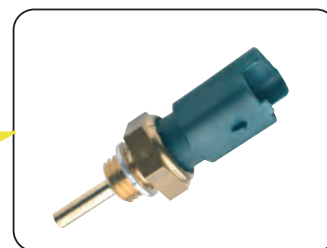

# 1.830.XXX COOLANT / OIL / FUEL TEMPERATURE SENDERS

Rendering: by kind concession of FIAT POWERTRAIN TECHNOLOGIES

Water temperature transmitters, installed in the conduit of the engine cooling circuit, measure the temperature of the coolant by means of a thermistor (a resistor, whose resistance depends on the temperature). The signal indicating the temperature is sent to the engine control unit in order to control the injection, for example when enriching the mixture during the car ignition phase at low temperatures.

engine are installed on the cooling circuit and can be constructively very similar or even identical. Transmitters with different functions can be installed on the same car.

Water temperature transmitters can be used with gasoline, diesel, hybrid and alcohol powered engines.

The main **causes of failure** of the product are:

- brake caused by mechanical stress
- sensor overheating
- Leaks
- short circuit

### Signs of malfunctions:

- high fuel consumption
- increased emissions
- power loss.
- difficulties starting the engine.
- engine overheating.
- warning light Engine Check.

Water temperature transmitters are designed and assembled to withstand the critical installation conditions inside the engine compartment. In particular, the following requirements shall be met:

- operating temperature:  $-30^{\circ}\text{C} \div +120^{\circ}\text{C}$
- degree of protection: IP67 (entrance of dust not allowed and protection against temporary water immersion effects).

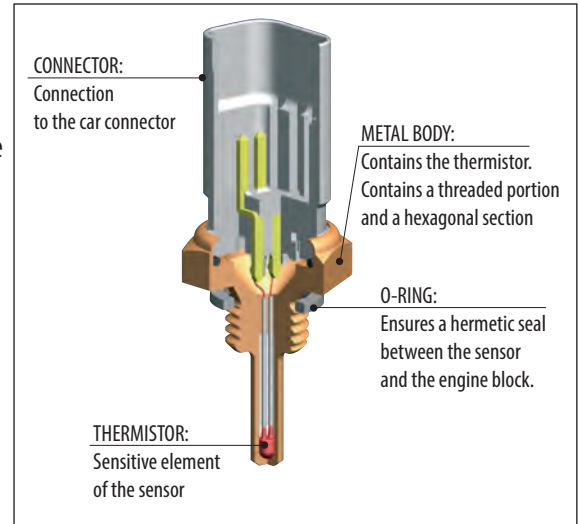

The water temperature transmitters undergo **qualification and endurance tests** to determine if the product is suitable for construction and sale:

- resistance to high temperatures
- resistance to thermal shocks
- resistance to impacts
- resistance to vibrations
- resistance to water immersion

When these tests have been passed and after the approval to manufacture has been given, the product, in the assembly process, is strictly checked through a series of cycles which include a **100% sensor resistance test**.

# Structural components and operating principles

The sensitive element of the transmitters, the thermistor, is placed into a protective metal body. The end containing the sensitive element is in contact with the liquid, hence its temperature, to be measured; the other end has a connector, generally made of plastic, which contains the terminals for the electrical contact. The leads of the thermistor are welded directly onto the contacts of the connector. The metal body is usually provided with a threaded portion and with a hexagonal section so that it can be installed on the car. In other cases, the body is cylindrical and is held in place by elastic components. A metal O-ring ensures a hermetic seal between the sensor and the engine block.

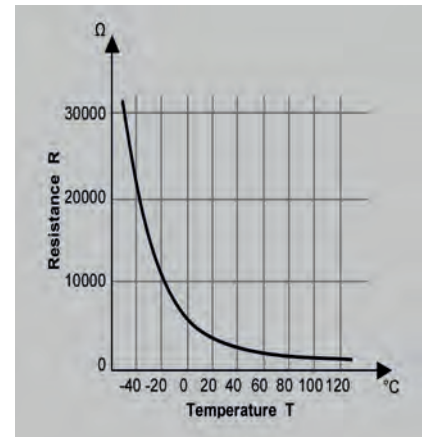

There are 2 types of transmitters, depending on the sensitive element:

## • NTC Thermistor (Negative Temperature Coefficient):

The resistance of the sensitive element (thermistor) will decrease as the temperature rises, thereby causing a decrease in the tension transmitted to the unit. The resistance, expressed according to the temperature, is approximated by an exponential curve:

$$R_T = R_{25} \exp \left\{ B \left( \frac{1}{T} - \frac{1}{298,15} \right) \right\} [\Omega]$$

T: Temperature [°C]  
 RT: resistance at temperature T  
 [Ω] R25: resistance at temperature of 25°C [Ω]  
 B: material constant [°C]

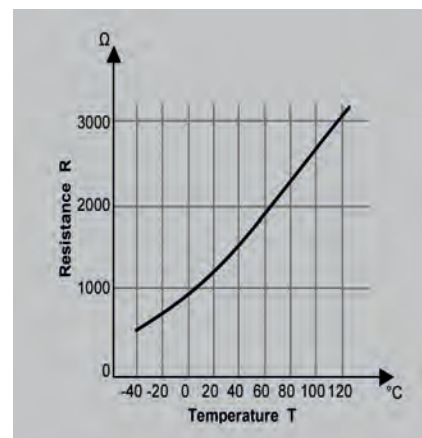

The NTC thermistors consist of a mixture of metal oxides and oxidized crystals which are produced through pressing with the addition of bonding agents and through further sintering.

## • Linear PTC Thermistor (Positive Temperature Coefficient):

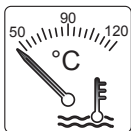

the resistance of the sensitive element (thermistor) will increase as the temperature rises, thereby causing an increase in the tension transmitted to the unit. The resistance, expressed according to the temperature, is approximated by a linear curve:

Linear PTC thermistors are made of silicon chips which make use of the conductive features of the crystal structure. They are achieved through photolithography, deposition of metals from the vapor phase as well as other common processes used in semiconductor technology.

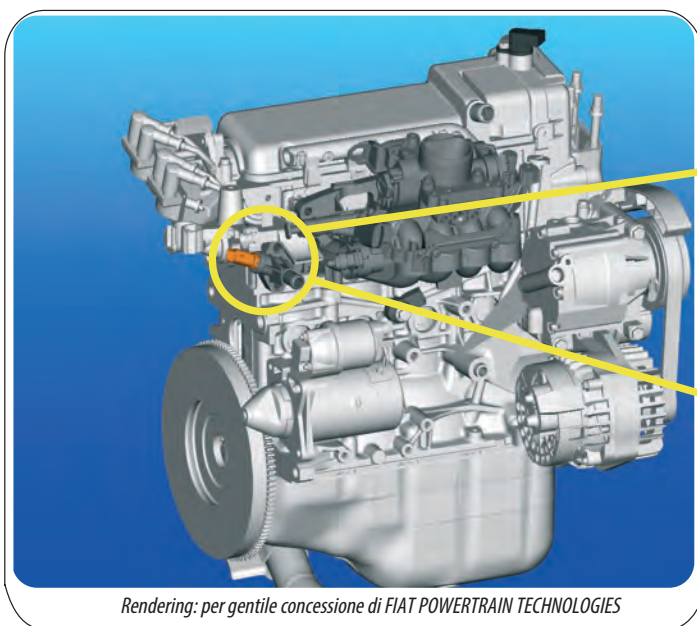

## Installation instructions

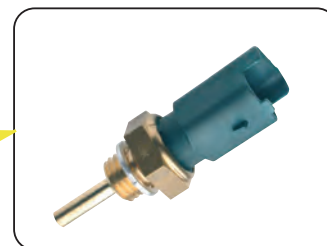

Tightening torque for water temperature sensors: 30÷50 Nm.

## 1.830.XXX SENSORI DI TEMPERATURA REFRIGERANTE/OLIO/CARBURANTE

Rendering: per gentile concessione di FIAT POWERTRAIN TECHNOLOGIES

I trasmettitori di temperatura acqua, montati nel condotto del circuito di raffreddamento del motore, misurano la temperatura del liquido di raffreddamento per mezzo di un termistore (resistore la cui resistenza dipende dalla temperatura). Il segnale indicante la temperatura è inviato alla centralina di controllo motore per gestire l'iniezione, ad esempio per l'arricchimento della miscela in fase di avviamento vettura alle basse temperature.

I trasmettitori temperatura acqua per gestione motore e per altre funzioni sono montati sul circuito di raffreddamento e costruttivamente possono essere molto simili se non identici. Sulla stessa vettura possono essere montati trasmettitori con funzioni diverse. I trasmettitori di temperatura acqua si possono applicare a veicoli con alimentazione a benzina, a gasolio, ibrida e ad alcol.

Le principali **cause di malfunzionamento** del prodotto sono:

- rottura causata da stress meccanico
- surriscaldamento del sensore
- perdite
- corto circuito

**Segnali di malfunzionamento:**

- consumi elevati
- aumento delle emissioni
- perdita di potenza.
- difficoltà di avviamento del motore
- surriscaldamento del motore
- Accensione della spia di avaria motore

I trasmettitori di temperatura acqua sono progettati e costruiti per sopportare le condizioni critiche di montaggio nel vano motore. In particolare devono soddisfare i seguenti

requisiti:

- temperatura di funzionamento:  $-30^{\circ}\text{C} \div +120^{\circ}\text{C}$
- grado di protezione: IP67 (ingresso di polveri non consentito e protezione contro gli effetti dell'immersione temporanea in acqua)

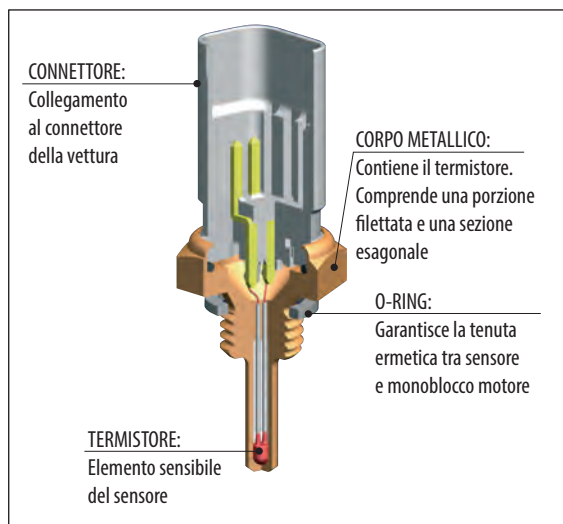

I trasmettitori di temperatura acqua sono sottoposti a **rigorose prove di qualificazione e di durata** per stabilire se il prodotto è idoneo per essere costruito e venduto:

- resistenza all'alta temperatura
- resistenza agli shock termici
- resistenza agli urti
- resistenza alle vibrazioni
- resistenza all'immersione in acqua

Superate tali prove e concesso il benestare a produrre, durante l'assemblaggio il prodotto viene sottoposto a severi cicli di controllo che prevedono il **collaudo al 100%** della resistenza dei sensori.

## Elementi costruttivi e principio di funzionamento

L'elemento sensibile dei trasmettitori, il termistore, è inserito in un corpo metallico protettivo. L'estremità contenente l'elemento sensibile è a contatto con il liquido di cui deve misurare la temperatura, l'altra estremità presenta un connettore, generalmente di materiale plastico, contenente i terminali per il contatto elettrico. I reofori del termistore sono saldati direttamente sui contatti del connettore. Il corpo metallico è provvisto, solitamente, di una porzione filettata e di una sezione esagonale per consentire il montaggio su vettura. In altri casi il corpo è cilindrico ed è trattenuto nella sede da organi elastici. Una guarnizione ad anello in metallo garantisce la tenuta ermetica tra sensore e monoblocco motore.

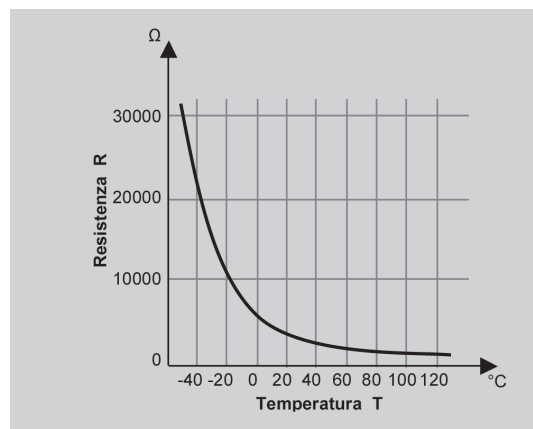

Esistono 2 tipologie di trasmettitori in funzione dell'elemento sensibile

### • Termistore NTC (a coefficiente di temperatura negativo):

Termistore NTC (a coefficiente di temperatura negativo): la resistenza dell'elemento sensibile (termistore) diminuisce all'aumentare della temperatura causando una diminuzione della tensione trasmessa alla centralina. La resistenza, espressa in funzione della temperatura, è approssimata da una curva esponenziale:

$$RT = R_{25} \exp \left\{ B \left( \frac{1}{T} - \frac{1}{298,15} \right) \right\} [\Omega]$$

|      |                                         |
|------|-----------------------------------------|
| T:   | Temperatura [°C]                        |
| RT:  | resistenza alla temperatura T [Ω]       |
| R25: | resistenza alla temperatura di 25°C [Ω] |
| B:   | costante del materiale [°C]             |

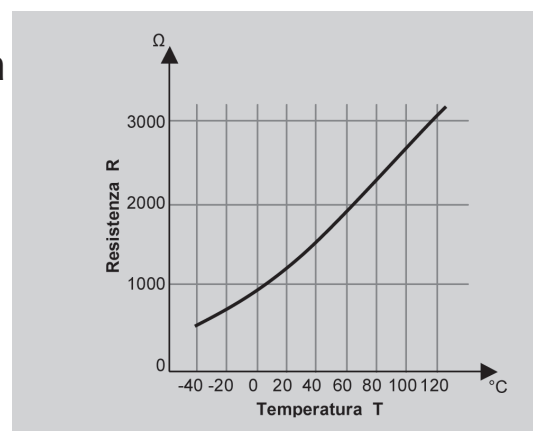

I termistori NTC sono formati da una miscela di ossidi di metallo e cristalli ossidati e sono prodotti mediante una pressatura con aggiunta di agenti leganti e una successiva sinterizzazione.

### • Termistore PTC lineare (a coefficiente di temperatura positivo):

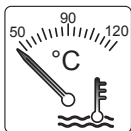

la resistenza dell'elemento sensibile (termistore) aumenta all'aumentare della temperatura causando un aumento della tensione trasmessa alla centralina. La resistenza, espressa in funzione della temperatura, è approssimata da una curva lineare:

I termistori di tipo PTC lineare sono realizzati in chip di silicio e ne sfruttano le caratteristiche conduttive della struttura a cristallo. Sono realizzati mediante fotolitografia, deposito di metalli in fase vapore e altri processi usuali della tecnologia dei semiconduttori.

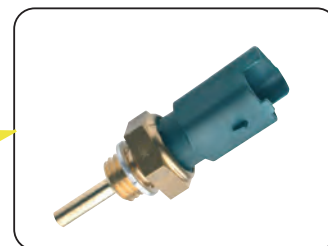

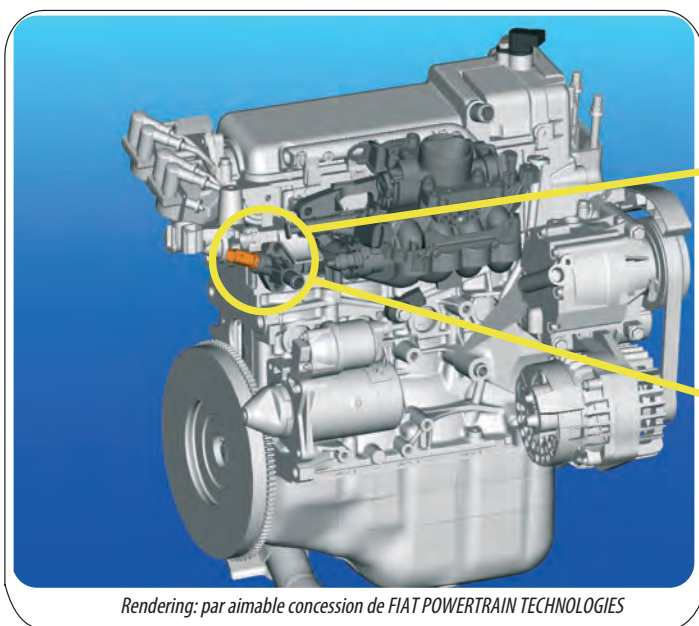

## Istruzioni di montaggio

Coppia di serraggio dei sensori temperatura acqua: 30÷50 Nm.

## 1.830.XXX CAPTEURS DE TEMPERATURE REFRIGERANT/HUILE/FUEL

Les contacteurs de température d'eau, montés dans le conduit du circuit de refroidissement du moteur, mesurent la température du liquide de refroidissement à l'aide d'un thermisteur (résistor dont la résistance dépend de la température). Le signal indiquant la température est envoyé à l'unité de contrôle du moteur pour gérer l'injection : par exemple, pour l'enrichissement du mélange en phase de démarrage de la voiture aux basses températures. Les contacteurs de température d'eau pour la gestion du moteur et autres fonctions sont montés sur le circuit de refroidissement et peuvent être fort semblables, voire identiques, du point de vue de leur construction. Une même voiture peut monter des contacteurs ayant des fonctions différentes. Les contacteurs de température d'eau trouvent leur application dans les véhicules alimentés à essence, au gasoil, hybrides et à alcool.

### Les principales causes de défaut sont:

- rupture causée par un stress mécanique
- surchauffe du capteur
- pertes
- court-circuit

### Les signaux de dysfonctionnement du capteur sont:

- consommation élevée
- augmentation des émissions
- perte de puissance
- difficulté à démarrer le moteur
- surchauffe du moteur
- allumage du voyant de panne moteur

Les contacteurs de température d'eau sont conçus et fabriqués pour supporter les conditions de montage critiques dans le compartiment

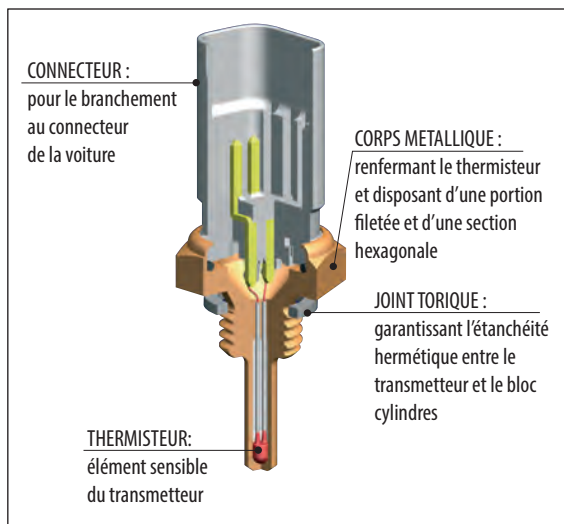

moteur. En particulier, ils doivent répondre aux caractéristiques suivantes :

- température de fonctionnement :  $-30^{\circ}\text{C} \div +120^{\circ}\text{C}$
  - degré de protection : IP67 (entrée de poussières non admis et protection contre les effets de l'immersion temporaire dans l'eau)
- Les contacteurs de température sont soumis à des **essais de qualification et de durée rigoureux** pour établir si le produit est adéquat à la fabrication et à la vente :
- résistance aux hautes températures
  - résistance aux chocs thermiques
  - résistance aux coups
  - résistance aux vibrations
  - résistance à l'immersion dans l'eau

À l'issue positive de ces essais et une fois l'autorisation de production accordée, le produit est soumis tout au long de son assemblage à de sévères cycles de contrôle envisageant le **test à 100%** de la résistance des contacteurs.

## Éléments constitutifs et principe de fonctionnement

L'élément sensible des contacteurs, le thermisteur, est inséré dans un corps métallique de protection. L'extrémité comportant l'élément sensible est en contact avec le liquide dont la température doit être mesurée, tandis que l'autre extrémité dispose d'un connecteur, généralement en matériau plastique, renfermant les bornes pour le contact électrique. Les conducteurs électriques du thermisteur sont soudés directement sur les contacts du connecteur. Le corps métallique possède habituellement une portion filetée et une section hexagonale pour en permettre le montage sur la voiture. Dans d'autres cas, le corps est cylindrique et est maintenu en place par des éléments élastiques. Un joint torique en métal assure l'étanchéité hermétique entre le transmetteur et le bloc cylindres.

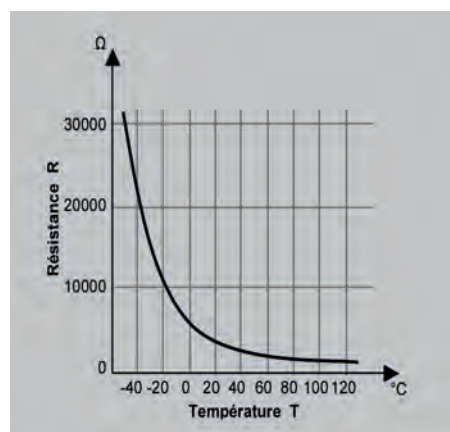

Il y a 2 typologies de contacteurs, en fonction de l'élément sensible:

### • Thermisteur NTC (à coefficient de température négatif):

La résistance de l'élément sensible (thermisteur) diminue alors que la température augmente et cela comporte une diminution de la tension qui est transmise à l'unité de contrôle. La résistance, exprimée en fonction de la température, est approchée par une courbe exponentielle :

$$R_T = R_{25} \exp \left\{ B \left( \frac{1}{T} - \frac{1}{298,15} \right) \right\} [\Omega]$$

|                   |                                      |
|-------------------|--------------------------------------|
| T:                | Température [°C]                     |
| R <sub>T</sub> :  | résistance à la température T [Ω]    |
| R <sub>25</sub> : | résistance à la température 25°C [Ω] |
| B:                | constante du matériel [°C]           |

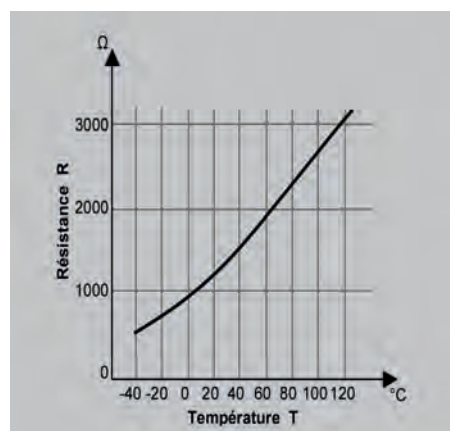

Les thermisteurs NTC, composées d'un mélange d'oxydes de métal et de cristaux oxydés, sont produites par pressage avec ajout d'agents liants et frittage successif.

### • Thermisteur PTC linéaire (à coefficient de température positif):

la résistance de l'élément sensible (thermisteur) augmente alors que la température augmente et cela comporte une augmentation de la tension qui est transmise à l'unité de contrôle. La résistance, exprimée en fonction de la température, est approchée par une courbe linéaire :

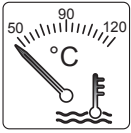

Les thermisteurs de type PTC linéaire sont réalisées à l'aide de puces en silicium et en exploitent les caractéristiques conductrices de la structure à cristal. Elles sont produites moyennant photolithographie, dépôt de métaux en phase vapeur et autres processus propres à la technologie des semi-conducteurs.

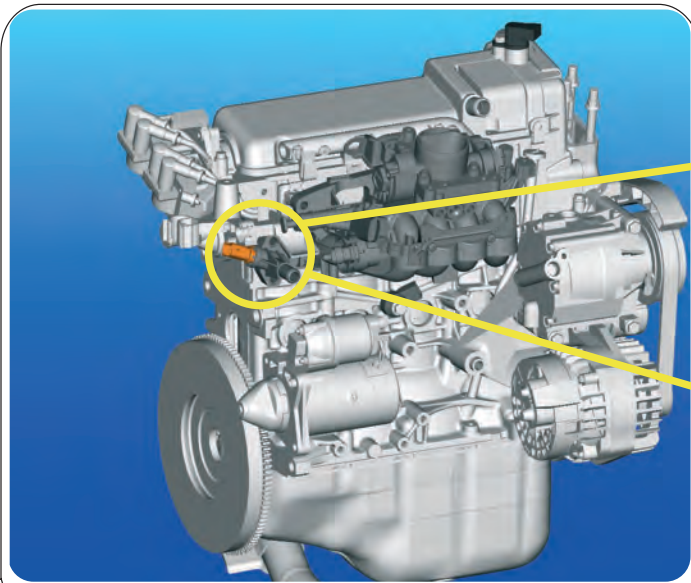

## Instructions de montage

Couple de serrage des contacteurs de température d'eau : 30÷50 Nm.

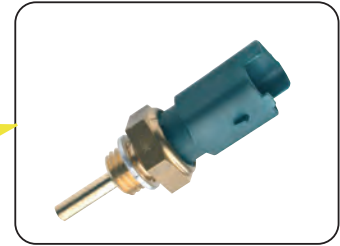

# 1.830.XXX TEMPERATURSENSOR FÜR KÜHLMITTEL/ÖL/KRAFTSTOFF

Rendering: bei freundlichem Zugeständnis von FIAT POWERTRAIN TECHNOLOGIES

Die Wassertemperaturimpulsgeber sind in der Leitung des Kühlkreises des Motors montiert und messen die Temperatur der Kühlflüssigkeit durch einen Thermistor (Widerstand, dessen Leistung von der Temperatur abhängt). Das Signal mit der Angabe der Temperatur wird der Steuerung des Motors für die Steuerung der Einspritzung gesendet, zum Beispiel für die Anreicherung der Treibstoffmischung beim Anlassen des Fahrzeuges bei niedrigen Temperaturen.

Für die Wassertemperaturimpulsgeber, die unterschiedliche Funktionen aufweisen (Steuerung der Anzeigeinstrumente, Antrieb des elektrischen Kühllüfters). Die Wassertemperaturimpulsgeber für die Steuerung des Motors sind auf dem Kühlkreis montiert und können in ihrer Bauweise sehr ähnlich, wenn nicht identisch ausgelegt sein. Auf demselben Fahrzeug können Sender mit unterschiedlichen Funktionen eingebaut sein.

**Die Hauptursachen für Defekte** des Produkts sind:

- Ausfall durch mechanische Beanspruchung
- Überhitzung des Sensors
- Leck
- Kurzschluss

**Die Anzeichen für Funktionsstörungen** des Produkts sind:

- Hoher Verbrauch
- Erhöhung der Emissionen
- Machtverlust.
- Schwierigkeiten beim Starten des Motors
- Motorüberhitzung
- Zündung der Warnleuchte für Motorfehler

Die Wassertemperaturimpulsgeber werden im Hinblick auf Planung

und Bau so ausgelegt, dass sie den kritischen Montagebedingungen im Motorraum standhalten. Insbesondere müssen sie folgende **Anforderungen** erfüllen:

- Betriebstemperatur:  $-30^{\circ}\text{C} \div +120^{\circ}\text{C}$
- Schutzart: IP67 (staubdicht und geschützt gegen die Wirkungen beim zeitweiligen Untertauchen in Wasser).

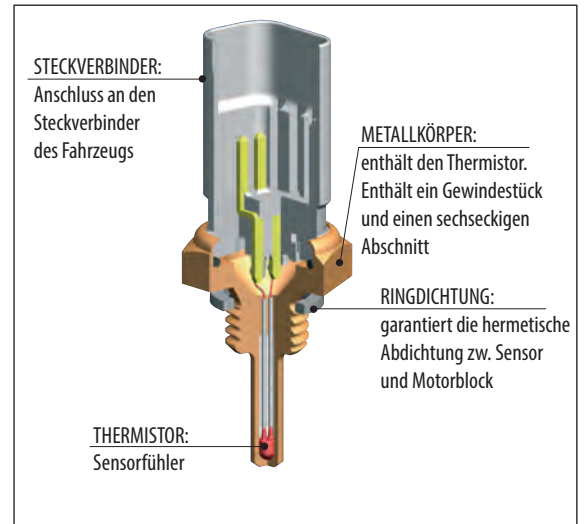

Die Wassertemperatur-Impulsgeber werden **Qualitäts- und Haltbarkeitstests** unterzogen, um festzulegen, ob das Produkt für den Bau und den Verkauf geeignet ist:

- Beständigkeit gegen hohe Temperaturen
- Beständigkeit gegen starke Temperaturschwankungen
- Stoßfestigkeit
- Schwingungsfestigkeit
- Beständigkeit beim Eintauchen in Wasser

Bei positiven Prüfergebnissen und nach Erteilen der Produktionsgenehmigung erfolgen während der Montage strenge Kontrollzyklen auf dem Produkt mit der **100% Abnahmeprüfung des Widerstands** der Sensoren.

## Bauteile und Funktionsprinzip

Der Fühler des Senders, d.h. der Thermistor, ist von einem Metallkörper geschützt. Das Ende mit dem Fühler steht in Berührung mit der Flüssigkeit, deren Temperatur gemessen werden soll. Das andere Ende ist mit einem Anschluss ausgerüstet, der in der Regel aus Kunststoffmaterial besteht und die Klemmen für den elektrischen Kontakt enthält. Die Leiter des Thermistors sind direkt auf den Kontakten des Anschlusses verschweißt. Der Metallkörper ist in der Regel mit einem Gewindestück und einem sechseckigen Abschnitt ausgestattet, damit die Montage auf dem Fahrzeug ermöglicht wird. In anderen Fällen ist der Körper zylindrisch ausgelegt und wird von Spannelementen eingespannt. Eine Ringdichtung aus Metall gewährleistet die hermetische Abdichtung zwischen Sensor und Motorblock.

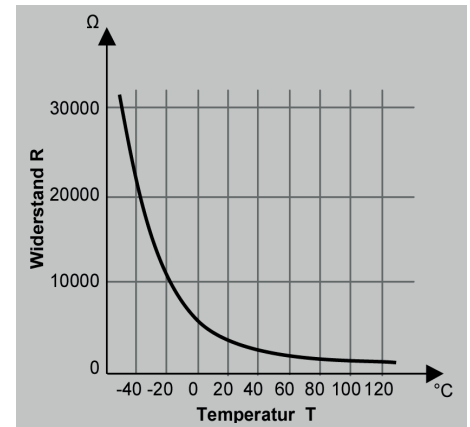

Je nach Fühler gibt es 2 verschiedene Arten von Sendern:

### • NTC-Thermistor (mit negativem Temperaturkoeffizienten):

Der Widerstand des Fühlers (Thermistor) verringert sich mit ansteigender Temperatur, wodurch die der Steuerung übertragene Spannung gesenkt wird. Der Widerstand wird je nach Temperatur von einer Exponentialkurve approximiert:

$$R_T = R_{25} \exp \left\{ B \left( \frac{1}{T} - \frac{1}{298,15} \right) \right\} [\Omega]$$

|      |                                    |
|------|------------------------------------|
| T:   | Temperatur [°C]                    |
| RT:  | Widerstand bei Temperatur T [Ω]    |
| R25: | Widerstand bei Temperatur 25°C [Ω] |
| B:   | Materialkonstante [°C]             |

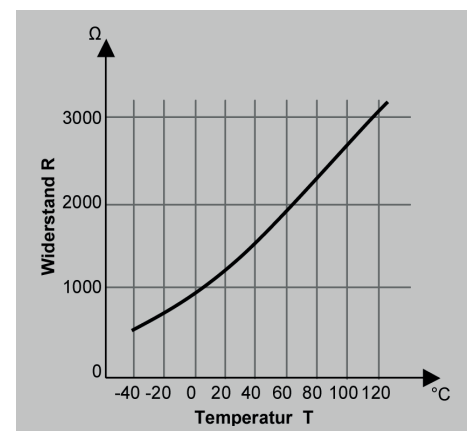

Die NTC-Thermistoren sind aus einer Mischung aus Metalloxiden und oxidierten Kristallen gebildet und durch eine Pressung mit dem Zusatz von Bindungsmitteln und einer nachfolgenden Sinterung geschützt.

### • PTC-Thermistor linear (mit positivem Temperaturkoeffizienten):

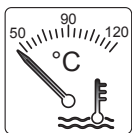

Der Widerstand des Fühlers (Thermistor) erhöht sich mit ansteigender Temperatur, wodurch die der Steuerung übertragene Spannung erhöht wird. Der Widerstand wird je nach Temperatur von einer linearen Kurve approximiert:

Die PTC-Thermistoren sind als Silizium-Chips ausgelegt und nutzen die leitenden Eigenschaften der Kristallstruktur. Sie werden mit Fotolithographie, Abscheidung von Metallen aus der Dampfphase sowie anderen der Technologie der Halbleiter entsprechenden Verfahren hergestellt.

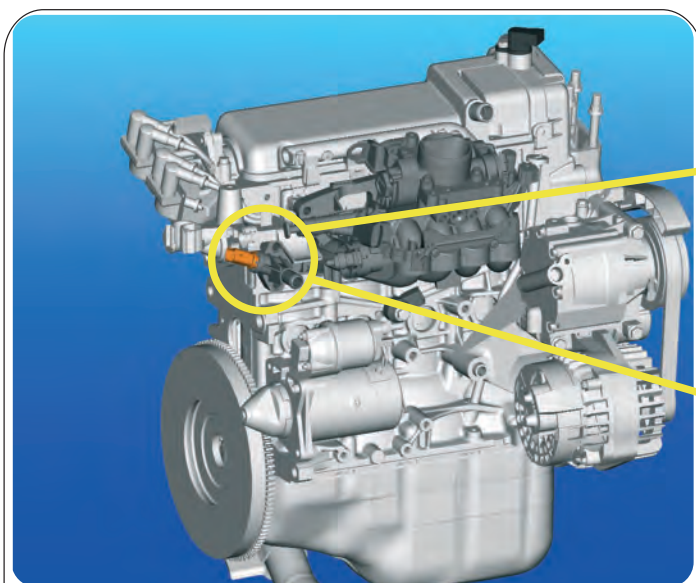

## Montageanweisungen

Anzugsmoment der Wassertemperaturimpgeber: 30÷50 Nm.

## 1.830.XXX SENSORES DE TEMPERATURA REFRIGERANTE/ACEITE/COMBUS

Rendering: por amable concesion de FIAT POWERTRAIN TECHNOLOGIES

Las termoresistencias para temperatura del agua, montados en el conducto del circuito de refrigeración del motor, miden la temperatura del líquido refrigerante mediante un termistor (resistor cuya capacidad de resistencia depende de la temperatura). La señal que indica la temperatura se envía a la centralita de control del motor para controlar la inyección, por ejemplo, para enriquecer la mezcla en fase de arranque del vehículo a bajas temperaturas.

Las termoresistencias para temperatura del agua para el control del motor y para otras funciones están montadas en el circuito de refrigeración y, desde un punto de vista de la construcción, pueden ser muy parecidos o idénticos. En el mismo vehículo se pueden montar termoresistencias con distintas funciones. Las termoresistencias para temperatura del agua se pueden instalar en vehículos con alimentación de gasolina, de gasoil, híbrida y de alcohol.

### Las principales causas de avería del producto son:

- Freno causado por estrés mecánico.
- sensor de sobrecalentamiento
- Fugas
- Cortocircuito

### Las señales de problemas de funcionamiento del sensor son:

- alto consumo de combustible
- aumento de emisiones
- pérdida de potencia.
- Dificultades para arrancar el motor.
- Sobrecalentamiento del motor.
- Señal de fallo del motor

Las termoresistencias para temperatura del agua están diseñadas

y fabricadas para soportar las condiciones críticas de montaje en el espacio motor. En especial, deben cumplir con los siguientes requisitos:

- temperatura de funcionamiento:  $-30^{\circ}\text{C} \div +120^{\circ}\text{C}$
- grado de protección: IP67 (entrada de polvo no permitida y protección contra los efectos de la inmersión temporánea en agua).

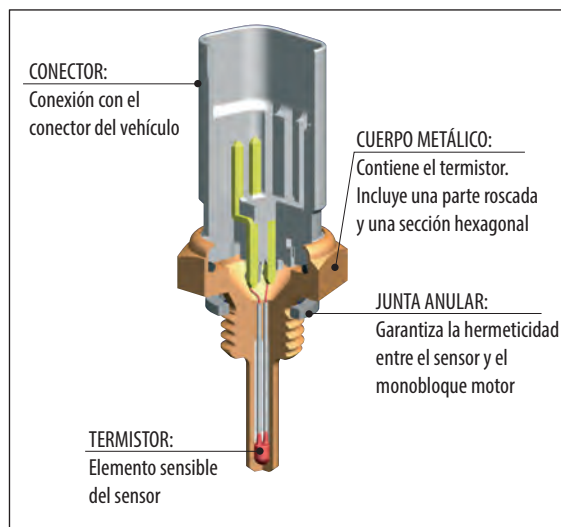

Las termoresistencias para temperatura del agua son sometidos a **rigurosos ensayos de calificación y de duración**, para determinar si el producto es apropiado para ser fabricado y vendido:

- resistencia a las altas temperaturas
- resistencia a los choques térmicos
- resistencia a los golpes
- resistencia a las vibraciones
- resistencia a la inmersión en agua

Después que ha superado estas pruebas y obtenido la aprobación para la producción, durante el ensamblaje el producto se somete a severos ciclos de control que prevén el **ensayo al 100%** de la resistencia de los sensores.

## Elementos de construcción y principio de funcionamiento

El elemento sensible de las termoresistencias, el termistor, está colocado en un cuerpo metálico de protección. El extremo que contiene el elemento sensible está en contacto con el líquido del que debe medir la temperatura; el otro extremo tiene un conector, generalmente de material plástico, que contiene los terminales para el contacto eléctrico. Los filamentos eléctricos del termistor están soldados directamente en los contactos del conector. El cuerpo metálico generalmente tiene una parte roscada y una sección hexagonal, para permitir el montaje en el vehículo. En otros casos, el cuerpo es cilíndrico y está fijado en el asiento con elementos elásticos. Una junta anular de metal garantiza la hermeticidad entre el sensor y el monobloque motor.

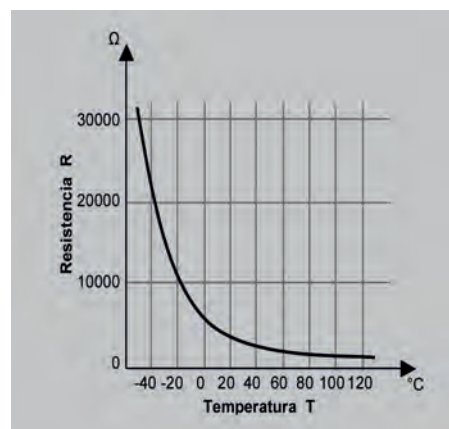

Existen dos tipos de termoresistencias, según el elemento sensible:

### • Termistor NTC (de coeficiente de temperatura negativo):

La resistencia del elemento sensible (termistor) disminuye a medida que aumenta la temperatura, generando una reducción de la tensión transmitida a la centralita. La resistencia, expresada según la temperatura, está aproximada por una curva exponencial:

$$R_T = R_{25} \exp \left\{ B \left( \frac{1}{T} - \frac{1}{298,15} \right) \right\} [\Omega]$$

|                   |                                       |
|-------------------|---------------------------------------|
| T:                | Temperatura [°C]                      |
| R <sub>T</sub> :  | resistencia a la temperatura T [Ω]    |
| R <sub>25</sub> : | resistencia a la temperatura 25°C [Ω] |
| B:                | constante del material [°C]           |

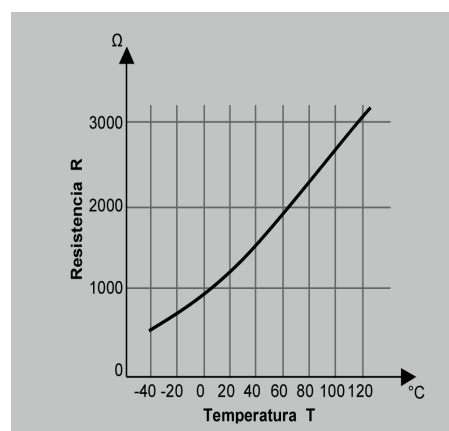

Los termistores NTC están formados por una mezcla de óxidos de metal y cristales oxidados y se fabrican mediante prensado, con el agregado de agentes aglutinantes y una posterior sinterización.

### • Termistor PTC lineal (de coeficiente de temperatura positivo):

La resistencia del elemento sensible (termistor) aumenta a medida que aumenta la temperatura, generando un aumento de la tensión transmitida a la centralita. La resistencia, expresada según la temperatura, está aproximada por una curva lineal:

Los termistores de tipo PTC lineal están realizados en chips de silicio y aprovechan las características de conducción de la estructura de cristal. Están realizados mediante fotolitografía, depósito de metales en fase vapor y otros procedimientos usuales de la tecnología de los semiconductores.

## Istrucciones de montaje

Par de torsión de los sensores de temperatura del agua: 30÷50 Nm.

## SKODA

357 919 501 A  
6U0 919 501 B

## VW

357 919 501 A  
6U0 919 501 B

**1074 Has the same colour as the original part Yellow**

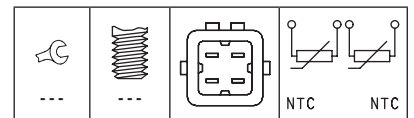

- corrisponde al pezzo originale colorato giallo
- Correspond à la pièce originale dans sa couleur jaune
- Entspricht dem Originalteil in Farbe gelb
- corresponde al color de la pieza original amarillo

**1078 Has the same colour as the original part Black**

- corrisponde al pezzo originale colorato nero
- Correspond à la pièce originale dans sa couleur noir
- Entspricht dem Originalteil in Farbe schwarz
- corresponde al color de la pieza original negro

**1079 Has the same colour as the original part Blue**

- corrisponde al pezzo originale colorato blu
- Correspond à la pièce originale dans sa couleur bleu
- Entspricht dem Originalteil in Farbe blau
- corresponde al color de la pieza original azul

## 1073 Has the same colour as the original part White

- corrisponde al pezzo originale colorato bianco
- Correspond à la pièce originale dans sa couleur blanc
- Entspricht dem Originalteil in Farbe weiß
- corresponde al color de la pieza original blanco

## COOLANT/OIL/FUEL TEMPERATURE SENDERS

Adatt./Suitable:

## AUDI

059 919 501  
078 919 501 B

## SEAT

059 919 501  
078 919 501 B

## SKODA

059 919 501  
078 919 501 B

## VW

059 919 501  
078 919 501 B

**1079** Has the same colour as the original part Blue

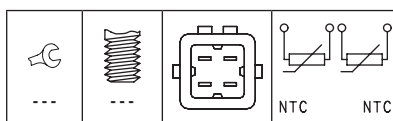

• corrisponde al pezzo originale colorato blu

• Correspond à la pièce originale dans sa couleur bleu

• Entspricht dem Originalteil in Farbe blau

• corresponde al color de la pieza original azul

## MARKET DIFFUSION: MEDIUM

## AUDI

## EPS 1.830.278K 3

### COOLANT/OIL/FUEL TEMPERATURE SENDERS

Adatt./Suitable:

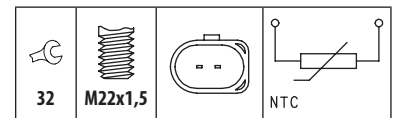

**AUDI**  
6R0 919 501  
**SEAT**  
6R0 919 501  
**SKODA**  
6R0 919 501  
**VW**  
6R0 919 501

<sup>150</sup> without connector parts

- Senza pezzi di raccordo
- sans raccords
- ohne Anschlusssteile
- sin piezas de conexión

**1.830.278**<sup>306</sup> Has the same colour as the original part Grey

- corrisponde al pezzo originale colorato grigio
- correspond à la pièce originale dans sa couleur gris
- Entspricht dem Originalteil in Farbe grau
- corresponde al color de la pieza original gris

## COOLANT/OIL/FUEL TEMPERATURE SENDERS

Adatt./Suitable:

**HYUNDAI**  
39220-38020  
39220-38030  
39230-26700

**KIA**  
25600-2CTA0  
39220-38020  
39220-38030  
39230-26700

\*Supplied only sensor, not connection

- Fornito solo il sensore, non il raccordo
- Fourni seulement capteur, sans raccord
- Geliefert Wird nur Sensor, keinen anschluß
- Suministrado solamente sensor, sin enchufe

MARKET DIFFUSION: HIGH
